

Deployment guide

This document consists of instructions on how to build and deploy the Maven Exercise. The deployment is tested on Apache Tomcat 7. This guide explains how the building is done with apache maven.

1. Extract the zip file of project
2. Use the command line to navigate into the project folder.
3. Type "mvn clean package" to build
4. Navigate into the Tomcat Manager Application with some web browser.
5. In the manager application Select the war file to upload. The war file will be in the target folder of the project
6. Deploy
7. You should now see the project deployed on your tomcat server named "/Maven_Exercise-1.0-SNAPSHOT"; Navigate into that page to use the web application.
